Continuous Emissions Monitoring and Process Control Brick Plants

Process control and emissions monitoring in a brick plant can be a challenge due to the high concentrations of HF. The HF is generated in the process and gas phase HF can reach 50 mg/m³ or higher. To use an extractive system in this environment will demand a lot of maintenance.

The OPSIS DOAS system is different and provides brick plants with an accurate analyser that will operate with a minimum of maintenance. The OPSIS DOAS system is based on a non-contact method using an optical measurement path that can operate across the duct.

The optical light is transported in an optical fibre to the analyser and one analyser can operate several paths.

A single OPSIS system can measure all relevant gas components such as NO_x, SO₂, CO, CO₂, H₂O, HCl, HF, and others.

RETURN OF INVESTMENT

The cost of investing in an OPSIS system is small compared to the amount of money that is spent on maintaining extractive measuring systems.

Many brick plants will have to install monitoring systems to meet the environmental requirements. Using the OPSIS system for process control will optimize the scrubber and the reduction of scrubbing material will pay for the investment in a short period of time.

TEST AND APPROVALS

The OPSIS system has been tested and approved by a number of internationally recognized institutes and authorities. The system meets the European directive for power plants and is approved by German TÜV, British MCERTS and U.S. EPA. Full details are available on request.

OPSIS PRODUCT PORTFOLIO

OPSIS has a full product portfolio for measurement of gases. It includes complete CEM systems according to the European waste directive, TDL systems for measuring NH₃ in NO_x scrubbers, O₂ analysers, and Hg analysers.

Accuracy

Better than 2% of measured value or equal to the detection limit (whichever is greater).

Span drift

Less than 2% per year.
Please, refer to QAL1 documents.

Zero drift

Less than 2% of measurement range per year.
Please, refer to QAL1 documents.

Linearity error

Less than 1% of measurement range.

⁽¹⁾ This data refers to a light path of 1 m. For longer paths the maximum range is proportionally smaller. Products are available to create shorter paths in very wide stacks.

⁽²⁾ Maximum SO₂ concentration 5 g/m³ × m.

⁽³⁾ Maximum SO₂ concentration 500 mg/m³ × m.

⁽⁴⁾ Monitoring path 5 m, measurement time 30 seconds.

⁽⁵⁾ Detection limit of 1 mg/m³ is optional with hardware upgrade.

⁽⁶⁾ Lowest measurement range.

- Recommended monitoring path length: 1 to 5 m.
- After wet scrubbers or when particulate concentration averaged over 1 m is higher than 5 g/m³, the monitoring path length may have to be reduced.
- Max. length of fibre optic cable: please refer to product sheets P9 and P16.

Continuous Emissions Monitoring and Process Control by OPSIS

No sampling required, non-contact measurement system
Operates with a minimum of maintenance
Best performance according to QAL 1 certification
Longest calibration interval according to QAL 1 certification
Automatic QAL 3 check as option
Low energy consumption
Gas calibration only once per year
Internationally approved
Thousands of systems installed worldwide
Serviced by highly skilled service network
